

ABSTRACT OF THE DISCLOSURE

The staff is joined to the central element of a base which comprises two lateral portions joined elastically by thin portions and by the co-molding of rubber layers to the central element; a fork member with a tubular extension is slidable along the staff and has S-shaped inner profiles to allow contact via rollers with the lateral portions of said base; a replaceable
5 assembly consisting of a sponge layer bonded to rigid flat elements can be detached to the base and released therefrom. The staff is detachable.
